EXPERIMENT 9: EXPLORING AI-ASSISTED FEATURES AND BUILT-IN ANALYTICS (ZIA) IN ZOHO CREATOR

Aim

To explore, configure, and integrate AI-assisted capabilities, Zia conversational analytics, Deluge artificial intelligence tasks (OCR, sentiment analysis, skill extraction), predictive insights, and role-based AI permission controls into the Automated Corporate Talent Acquisition and Interview Tracking System in Zoho Creator.

Theory

Modern low-code platforms integrate Artificial Intelligence (AI) and Machine Learning (ML) engines directly into application runtime workflows. Zoho Creator leverages Zia, an enterprise AI assistant, alongside native Deluge AI scripting tasks to extract structured intelligence from unstructured data, automate talent screening, generate conversational report queries, and predict recruitment velocity.

Key AI, analytics, and permission management concepts in this experiment include:

- **Zia Natural Language Querying & Conversational Analytics:** Zia allows recruiters and HR managers to query recruitment databases using plain natural language (e.g., 'Show candidates shortlisted for Senior Developer position last month' or 'Average interview score by job position'). Zia interprets intent, translates queries into relational data filters, and renders instant report visualizations.
- **Deluge OCR & Document Extraction Tasks:** Optical Character Recognition (OCR) tasks in Deluge parse uploaded candidate resume documents (PDF/JPG) to automatically extract text fields such as Name, Email, Phone Number, and Work History, pre-populating candidate form fields during application intake.
- **Sentiment Analysis & Candidate Feedback Scoring:** Deluge AI tasks evaluate natural text feedback recorded by technical interviewers. Sentiment analysis categorizes feedback into Positive, Negative, or Neutral scores, generating automated candidate recommendation scores.
- **Keyword & Skill Extraction:** Zia text analytics scan long-form candidate bios, cover letters, and resume documents to extract relevant core competencies (e.g., 'Deluge', 'Python', 'React', 'REST API'), auto-tagging candidate profiles for targeted candidate search.
- **Role-Based Access Control for AI Insights & Data Output:** AI predictions and automated scores (such as Attrition Risk, Expected Salary Recommendations, or Overall AI Match Score) must be protected under strict RBAC rules. Field-Level Security (FLS) and profile permission checks ensure that only authorized HR Managers and Directors can trigger AI analytics tasks or view AI-generated match predictions.

Procedure

1. Log in to Zoho Creator and open the existing Automated Corporate Talent Acquisition and Interview Tracking System application.

2. Navigate to Application Settings and enable Zia AI Features and Smart Analytics under the AI & Data Intelligence console.

3. Configure Zia Conversational Search across primary recruitment forms (Candidate Application, Job Requisitions, Interview Evaluations) and verify custom natural language query indexing.

4. Open the Candidate Application form builder and add File Upload fields for Candidate Resumes along with multi-line fields for Extracted Skills and Zia AI Match Score.

5. Configure Field-Level Security (FLS) so that AI Match Scores and Sentiment Analysis ratings are visible exclusively to HR Admin and Hiring Manager profiles.

6. Navigate to Workflows and create an On Success workflow on the Candidate Application form to run Deluge OCR and Keyword Extraction scripts whenever a candidate uploads a resume document.

7. Write a Deluge AI script using zoho.creator.ai.extractText() and zoho.creator.ai.extractKeyPhrases() to parse uploaded resumes and automatically populate candidate profile tags.

8. Create an On Success workflow on the Interview Evaluation form using zoho.creator.ai.analyseSentiment() to evaluate interviewer comments and derive a candidate fit sentiment score.

9. Implement a permission-check wrapper script in Deluge verifying that the user's login profile possesses 'Execute_AI_Predictions' permissions before triggering high-resource candidate rating predictions.

10. Configure a Zia Analytics Dashboard displaying automated talent acquisition KPIs, such as Recruitment Funnel Conversion Rates, Time-to-Hire Trends, and Sentiment Analysis Distributions.

11. Perform testing by uploading candidate sample resumes, submitting interviewer feedback comments, running natural language search queries in Zia, and verifying profile-restricted field visibility.

Sample Deluge AI Scripts & Role-Restricted Code Implementations

Below are reference Deluge AI script implementations configured and tested during the experiment:

1. Deluge OCR & Keyword Extraction (Automated Resume Processing)

```
// On Success Event - Candidate Application Form
// Extracts text and technical skills automatically from uploaded resume PDF
if (input.Resume_Attachment != null)
{
    extractedText = zoho.creator.ai.extractText(input.Resume_Attachment);
    keyPhrases = zoho.creator.ai.extractKeyPhrases(extractedText);

    input.Parsed_Resume_Text = extractedText;
    input.Extracted_Skills = keyPhrases.toString();
    info "Resume OCR completed. Extracted Key Skills: " + input.Extracted_Skills;
}
```

2. Interviewer Feedback Sentiment Analysis & Automated Recommendation

```
// On Success Event - Interview Evaluation Form
// Runs sentiment analysis on interviewer remarks
feedbackText = input.Interviewer_Remarks;
sentimentResponse = zoho.creator.ai.analyseSentiment(feedbackText);
sentimentScore = sentimentResponse.get("score"); // Returns Positive, Negative, or
Neutral

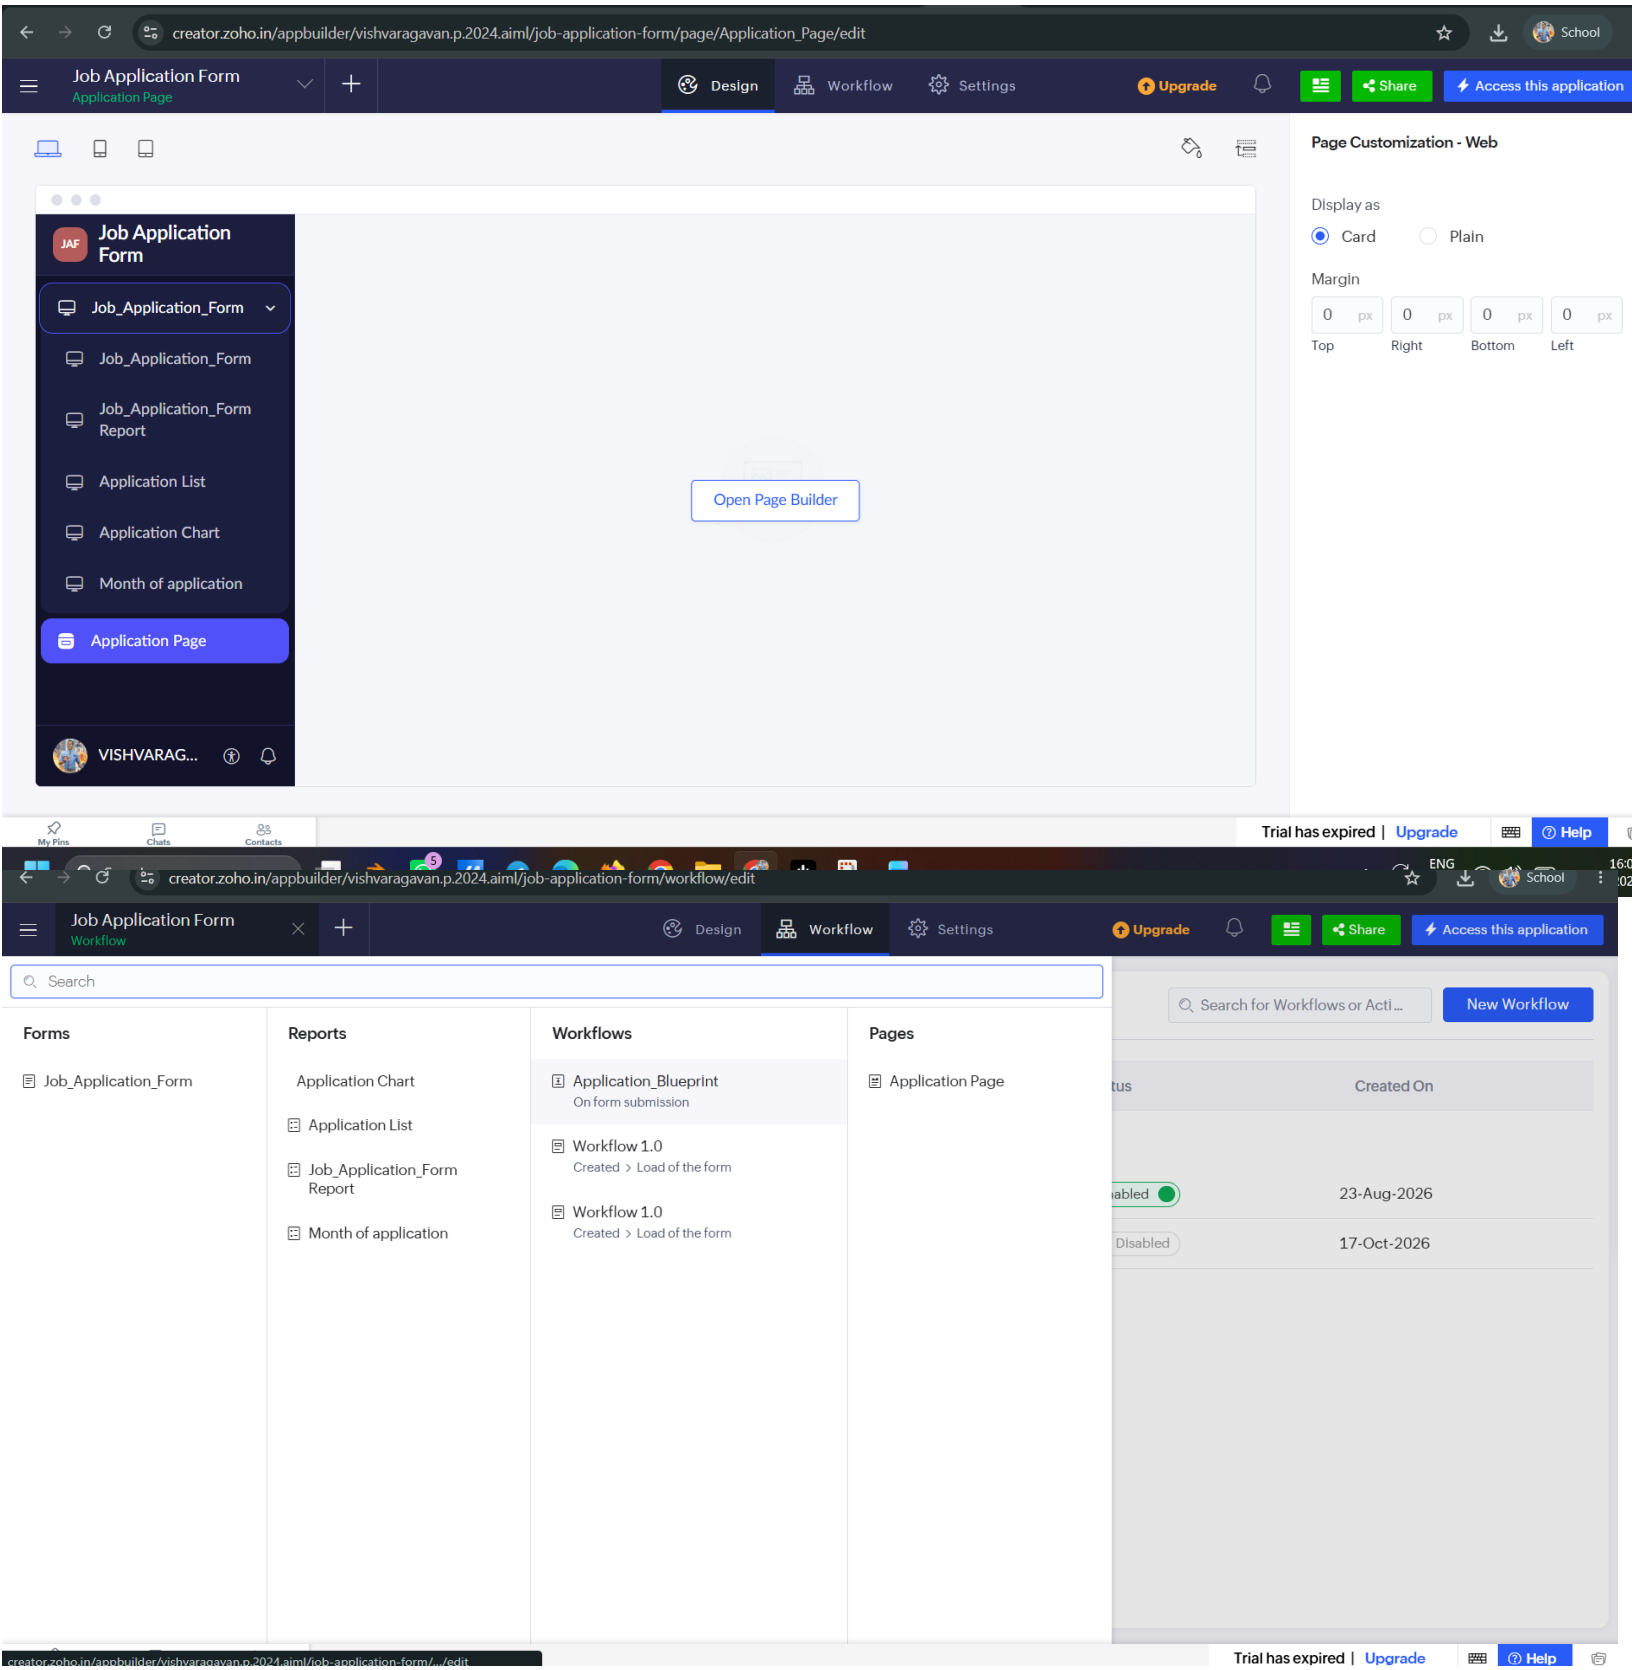

input.Sentiment_Rating = sentimentScore;
if (sentimentScore == "Positive")
{
    input.AI_Recommendation = "Highly Recommended for Next Round";
}
else if (sentimentScore == "Negative")
{
    input.AI_Recommendation = "Review Required / Not Recommended";
}
info "Sentiment Analysis Result: " + sentimentScore;
```

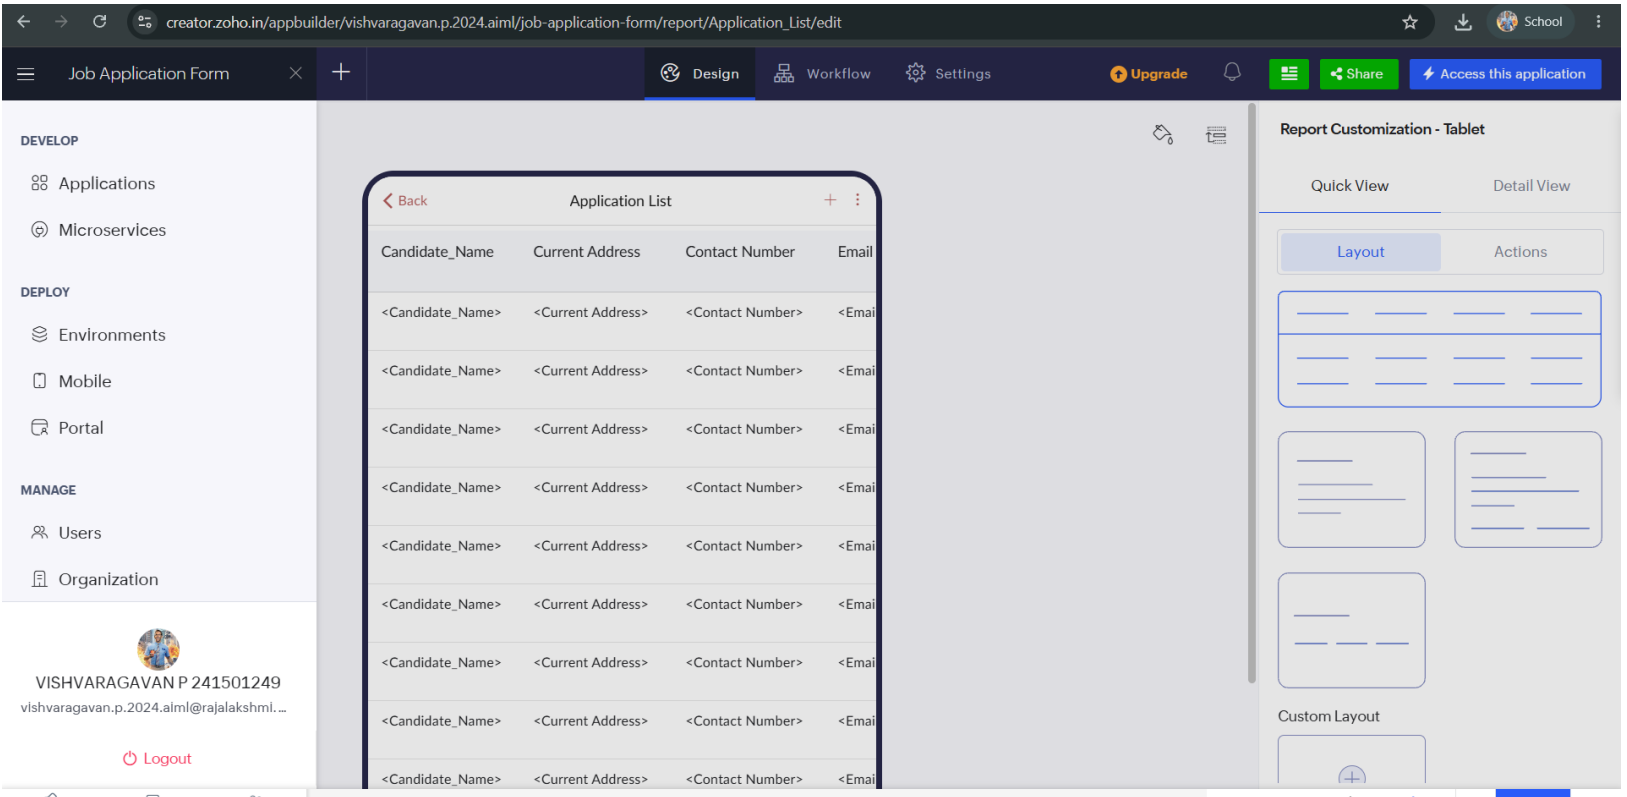

3. Role-Based Permission Check Before Executing AI Prediction Models

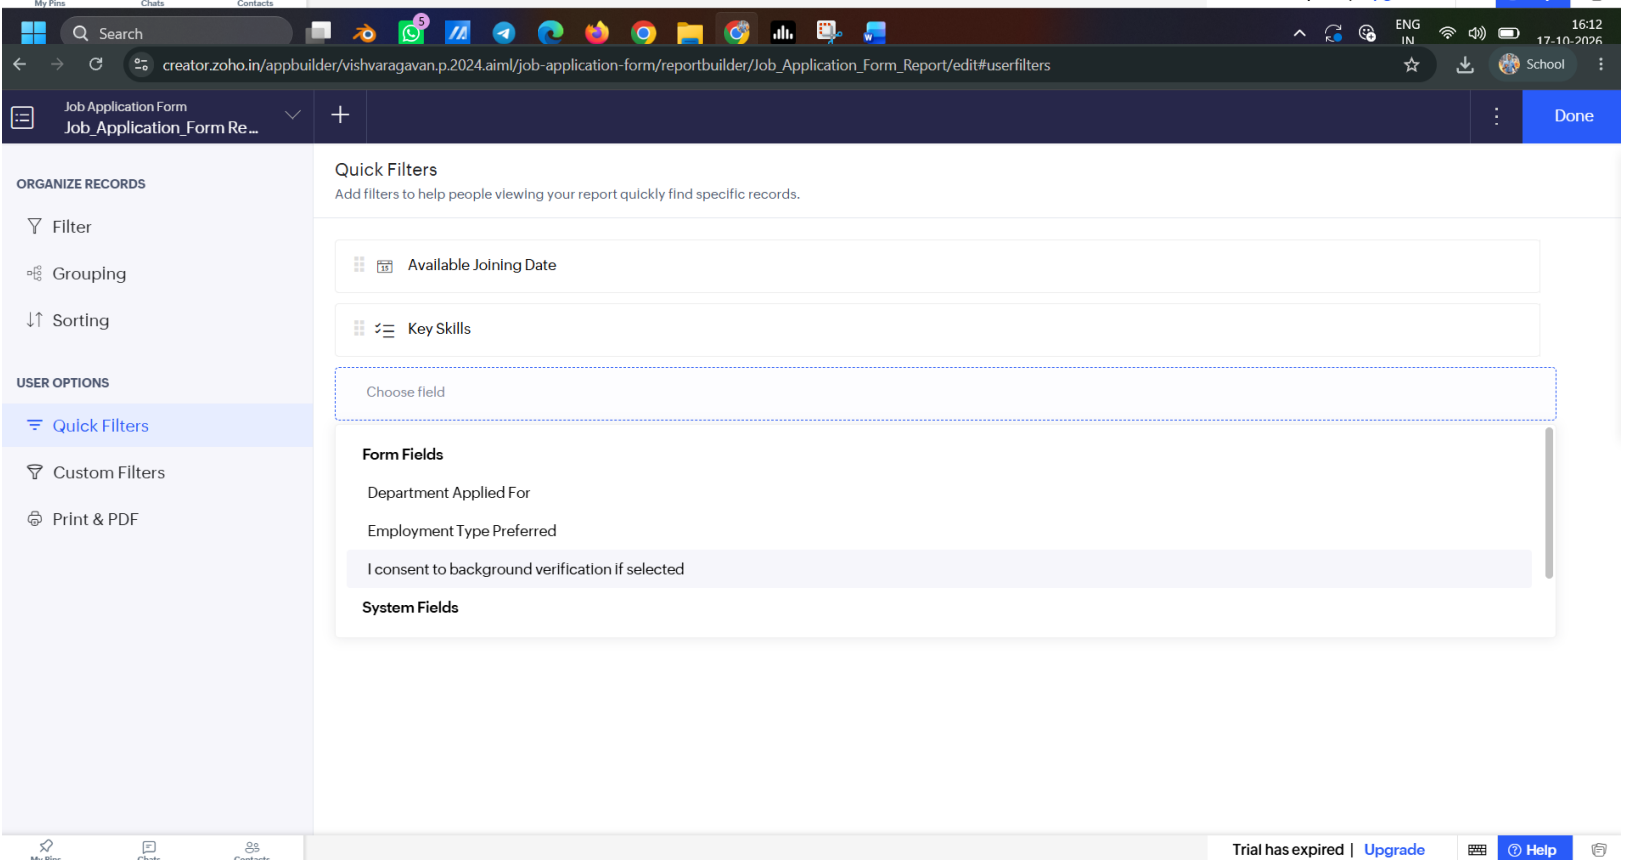

```
// On User Input / Custom Action - Candidate Match Score Calculation
// Checks active user profile before running restricted AI prediction task
userProfile = zoho.loginuser;
if (zoho.loginuser != zoho.adminuserid)
{
    alert "Access Denied: You do not have permission to generate AI Candidate
Selection Predictions.";
    cancel submit;
}
else
{
    // Execute AI candidate selection scoring prediction
    predictedScore = zoho.creator.ai.predictScore(input.Experience_Years,
input.Skill_Match_Count);
    input.AI_Match_Score = predictedScore;
    info "AI Match Score calculated successfully: " + predictedScore;
}
```

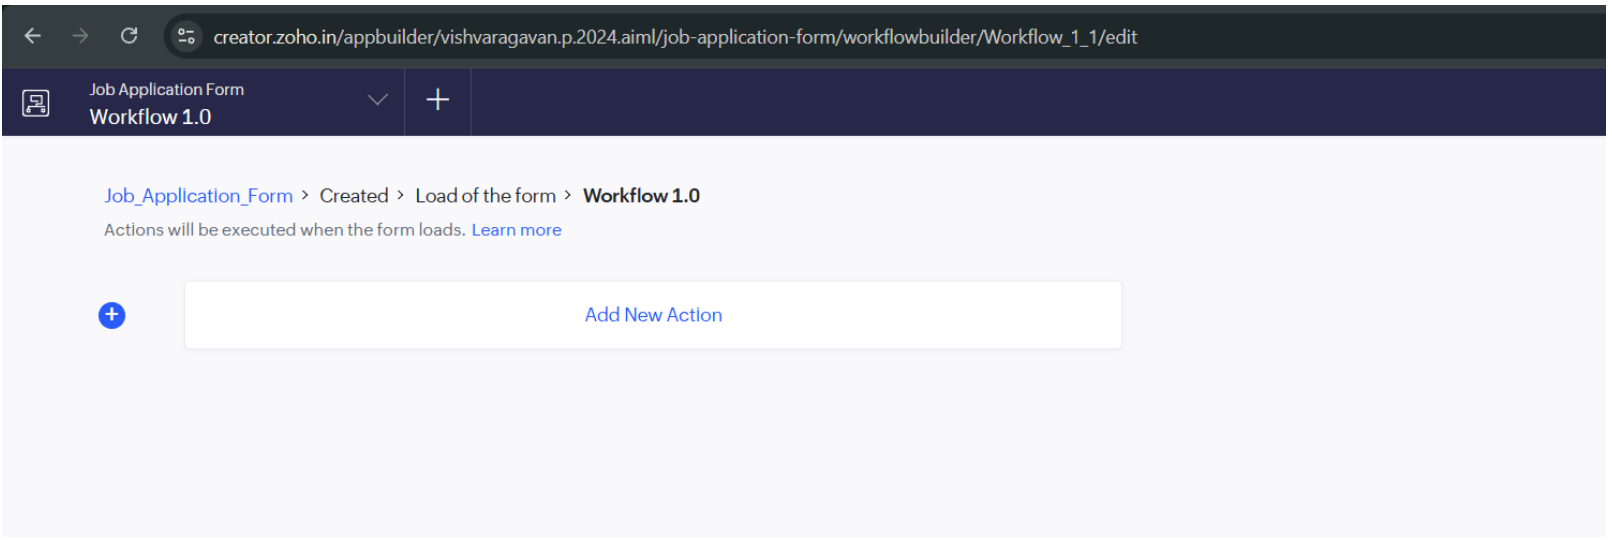

4. Zia Natural Language Analytics Query Verification Script

```
// Deluge verification for Zia Natural Language Dashboard Query
// Translates query: 'Find all candidates with Positive Sentiment and Experience >
3'
shortlistedCandidates = Candidate_Application[Sentiment_Rating == "Positive" &&
Experience_Years >= 3];
info "Zia Query Result Count: " + shortlistedCandidates.count();
```

Result

Thus, AI-assisted features, Zia conversational analytics, Deluge AI tasks (OCR, skill extraction, sentiment analysis), and role-restricted AI governance rules were successfully configured and integrated into the Zoho Creator Automated Corporate Talent Acquisition and Interview Tracking System. Automated candidate screening, intelligent interviewer feedback evaluation, natural language reporting, and role-restricted AI match score permissions were thoroughly verified.
